PROFESSIONAL SUMMARY

Aspiring SOC Analyst with hands-on experience in log analysis, SIEM concepts, vulnerability assessment, and incident detection, built through self-directed projects and structured labs. Won 1st place in a competitive in-house CTF at Offenso Hackers Academy. Developed WinLog Sentinel, a Flask-based platform for Windows Event Log analysis and SOC investigation, and practiced offensive and defensive techniques using Nmap, Wireshark, Burp Suite, and Metasploit on TryHackMe and Hack The Box. Comfortable mapping attacker behavior to MITRE ATT&CK and documenting findings clearly. Pursuing CompTIA Security+ to formalize this foundation.

EXPERIENCE

Cybersecurity Intern (Ongoing) | Hackware | 2026 – Present

- Performing vulnerability identification and security assessments on lab environments, applying structured methodologies to evaluate exposure and risk.
- Supporting security monitoring exercises and documenting findings in structured reports, building habits aligned with real-world SOC reporting standards.

PROJECTS

WinLog Sentinel | 2026

Technologies: Python, Flask, SQLite, Windows Event Logs, MITRE ATT&CK

- Built a full-stack SOC investigation platform (Python, Flask, SQLite) that ingests Windows Event Logs and surfaces logon activity, privilege use, and process execution for analyst review.
- Designed an investigation timeline feature and fixed a false-positive correlation bug by requiring simultaneous username and source-IP matching, sharpening alert-to-incident accuracy.
- Added an IP investigation module with aggregated activity stats and clickable source-IP drill-down, and mapped flagged event patterns to MITRE ATT&CK techniques.

Rogue USB HID Attack Simulation | 2026

Technologies: Digispark ATtiny85, Kali Linux, MITRE ATT&CK

- Built a rogue HID attack simulation using a Digispark microcontroller to emulate a USB keyboard and auto-inject keystrokes, demonstrating a USB drop attack with no user interaction required.
- Mapped the attack chain to MITRE ATT&CK techniques T1059, T1200, and T1204, then proposed defensive controls including USB device restriction policies and EDR-based alerting for keystroke injection behavior.

Password Strength Analyzer | 2026

Technologies: Python

- Built a Python CLI tool that scores password strength using length, character diversity, and common-pattern checks, flagging credential risks against standard policy guidelines.
- Added a dictionary-based check against frequently used and easily guessable passwords to model real-world credential-stuffing risk.

TECHNICAL SKILLS

Security Tools: Nmap, Wireshark, Burp Suite, Metasploit, John the Ripper

Operating Systems: Kali Linux, Windows

Security Concepts: Vulnerability Assessment, Incident Detection, Log Analysis, Security Monitoring, SIEM Fundamentals, MITRE ATT&CK

Platforms: TryHackMe, GitHub, Hack The Box

SOFT SKILLS

Analytical Thinking, Attention to Detail, Report Writing & Documentation, Problem-Solving, Communication, Team Collaboration

CERTIFICATIONS & ACHIEVEMENTS

- 1st Place, "Beloved" In-House CTF — Offenso Hackers Academy, Trivandrum (Feb 2026)
- TryHackMe — Advent of Cyber 2025, 24 challenges completed (Cert. ID: THM-XGCV3KEXUB)
- CompTIA Security+ — In Progress

EDUCATION

- Advanced Diploma in Information Security (ADIS) — Expected July 2026
- Diploma in Computer Engineering — SBTE Kerala | 2025

LANGUAGE

English, Malayalam
